1.0 EXECUTIVE SUMMARY

PBS Engineering and Environmental Inc. (PBS) recently performed a lead hazard assessment at Hayhurst Elementary School, B-classrooms 14 and 15, in Portland, Oregon. This service was performed because of concerns regarding potential lead exposures associated with lead paint in these rooms.

The following is a summary of findings:

- PBS performed a visual assessment of painted and varnished surfaces in the aforementioned classrooms. Most painted surfaces appeared to be in good or fair condition with minor contact damage. PBS did find the varnished surfaces of the lower cabinet faces around the sinks and painted window sashes and bases to be in poor condition. Paint and varnish conditions were assessed using US Department of Housing and Urban Development (HUD) guidelines, as shown in Table 1. The condition assessment is presented in Table 2, attached to this report.
- A total of forty-four (44) surface readings using a X-Ray Fluorescence Analyzer (XRF) were collected in both rooms. No painted or varnished surfaces were identified as lead-based paint. The complete list of surface readings is presented in Table 2 attached to this report.
- A total of fourteen (14) dust wipe samples were collected from floors, windowsills, window troughs, and desks. Twelve (12) of the samples collected were below the limits of detection. Two (2) samples collected in window troughs contained 15,000 and 20,000 micrograms per square foot ($\mu\text{g}/\text{ft}^2$) of lead. As a result of the testing, no lead dust hazards were identified within the functional space of the rooms on interior surfaces tested; however, results indicate that there is a lead dust hazard within the window troughs. The complete list of surfaces wiped is presented in Table 3, attached to this report.
- A total of two (2) bulk paint chip samples were collected from the window sashes. The concentration of lead in the samples are 10,000 parts per million and 12,000 parts per million (PPM). These components are considered lead-based paint. The list of components tested is presented in Table 4, attached to this report.

Based on the findings of this investigation, paint found in poor condition should be stabilized and window troughs need to be cleaned. PBS recommends that the windows remain closed until an Oregon Health Division certified abatement firm using certified workers can clean the window troughs and surrounding interior and exterior surfaces. After cleaning, a certified renovation repair and painting (RRP) contractor, using lead-safe work practices, should repaint the window components and lower cabinetry in the rooms.

2.0 SCOPE OF THE ASSESSMENT

On September 13, 2016, PBS conducted a lead hazard assessment that included a visual assessment of painted surfaces; XRF testing of major representative building components; bulk paint chip sampling of damaged window sashes; and dust wipe sampling of floors, desktops, window sills, and window troughs in these two rooms. All assessment work was completed by an Oregon Health Authority certified lead risk assessor (CIH). This lead hazard assessment was limited to the B-classrooms 14 and 15 within the building. No other assumptions or conclusions are implied.

3.0 BACKGROUND

Lead-containing paint is ubiquitous in the built environment. As paint degrades over time, lead can be released into the environment. This is a result of the degradation and erosion of lead containing

paint. Regulations have been developed over the years to address this potential exposure hazard. Lead concentrations upwards of 50 percent were common in older paints while newer paint, since 2009, has been limited to 90 ppm per the Consumer Product Safety Commission (CPSC).

Most lead exposures occur when a person ingests or breaths lead particulate. Lead ingestion typically occurs when a person has lead residues on his or her hands and then transfers those residues to the food he or she eats.

Currently, lead hazards are controlled through various Environmental Protection Agency (EPA) and Department of Housing and Urban Development (HUD) regulations.

Following is a listing of definitions and abbreviated discussions applicable to this project.

4.0 DEFINITIONS

40 CFR 745.103 definition of lead-based paint

Lead-based paint means paint or other surface coatings that contain lead equal to or in excess of 1.0 milligram per square centimeter (1mg/cm²) or 0.5 percent by weight (5,000ppm).

40 CFR 745.65 definitions of lead-based paint hazards

(a) Paint-lead hazard. A paint-lead hazard is any of the following:

(1) Any lead-based paint on a friction surface that is subject to abrasion and where the lead dust levels on the nearest horizontal surface underneath the friction surface (e.g., the window sill, or floor) are equal to or greater than the dust-lead hazard levels identified in paragraph (b) of this section.

(2) Any damaged or otherwise deteriorated lead-based paint on an impact surface that is caused by impact from a related building component (such as a doorknob that knocks into a wall or a door that knocks against its doorframe).

(3) Any chewable lead-based painted surface on which there is evidence of teeth marks.

(4) Any other deteriorated lead-based paint in any residential building or child-occupied facility or on the exterior of any residential building or child-occupied facility.

(b) Dust-lead hazard. A dust-lead hazard is surface dust in a residential dwelling or child-occupied facility that contains a mass-per-area concentration of lead equal to or exceeding 40 µg/ft² on floors or 250 µg/ft² on interior windowsills based on wipe samples.

40 CFR 745.227 Dust lead clearance levels (by wipe sampling)

40 µg/ft² – floors (includes carpeted and uncarpeted interior floors)

250 µg/ft² – interior windowsills

400 µg/ft² – window troughs (previously called “window wells” in some literature)

5.0 SAMPLING

5.1 XRF Sampling

PBS performed surface sampling A handheld Innovex LBP-4000 X-Ray Fluorescence Analyzer (XRF) was used to perform an analysis of painted and varnished surfaces. All calibration readings were within the tolerance for this instrument. No substrate correction is required with the Innovex XRF per the instrument's performance characteristic sheet.

The "side" information presented on the XRF data sheets relates to the side of the rooms where the XRF test spot is located. The risk assessor used the main entry door of each room as the basis to establish side "A"; sides B, C, and D follow in clockwise rotation.

5.2 Dust Sampling

The purpose of dust sampling is to determine the lead concentration in settled dust. Dust is an important pathway for childhood exposure to lead. Children can be exposed to leaded dust by inhalation or ingestion. Ingestion of leaded dust is a common pathway, especially for kids six years old and younger, during normal hand to mouth activities involving their fingers or toys that have come in contact with leaded dusts.

Wipe sampling is the recommended method for collecting surface dust samples. Dust samples are typically collected from floors near friction and impact spots or areas of deteriorated paint, interior windowsills, and window troughs. Cabinets, shelves, and tabletops may also be sampled if there is reason to suspect a surface dust hazard may exist caused by friction, impact points, or from areas of deteriorated paint nearby.

Dust wipes were collected in accordance with EPA 747-R-95-001, Residential Sampling for Lead: Protocols for Dust and Soil Sampling. All wipe samples were analyzed using EPA Method SW846-7000B, flame atomic absorption. Sample collection results and their locations are presented in Table 3.

5.3 Bulk Paint-Chip Sampling

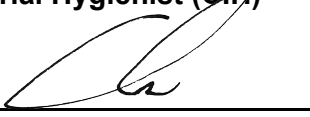

A total of two bulk paint-chip verification samples were collected from damaged painted window component surfaces. Representative paint-chip samples were submitted to a qualified lab for analysis by atomic absorption via EPA Method 7420. Bulk paint-chip sample laboratory results are presented in Table 4.

6.0 LIMITATIONS OF SCOPE

This study was limited to the tests and locations as indicated above. The site as a whole may have other environmental concerns that will not be characterized by this study. Further study may be recommended. The findings and conclusions of this work are not scientific certainties are probabilities based on professional judgment concerning the significance of the data gathered during the course of this investigation. PBS is not able to represent conditions on the site or adjoining sites beyond those conditions detected or observed by PBS.

Comments: Lead wipe analysis by EPA 7000B is accredited by AIHA-LAP, LLC (Lab ID 100364) and NY-DOH (Lab ID 10884)

Report Qualifiers (Q):

H = Holding times for preparation or analysis exceeded

E = Value above highest calibration standard

J = Estimated Value - Result is below lowest calibration standard.

 L = LCS (Laboratory Control Standard)/SRM (Standard Reference Material) recovery
 outside accepted recovery limits

B = Analyte detected in the associated Method Blank

S = Spike Recovery outside accepted limits

R = RPD (relative percent difference) outside accepted limits

D = RL (reporting limit verification) outside accepted limits

RE: LEAD-BASED PAINT ACTIVITIES, INDIVIDUAL CERTIFICATION NO. 1806--Indv--R

This letter is your official notification that you have met the certification requirements under Oregon Administrative Rule (OAR) 333-069 to conduct lead-based paint activities in Oregon, in the following disciplines: Risk Assessor; Inspector

In addition to certification by the Oregon Health Authority, you are required to be licensed by the Construction Contractors Board (CCB) if you plan to conduct lead-based paint activities in Oregon. This license is different than, and in addition to, the standard contractor license issued by CCB. Both individuals and firms must obtain this license. For more information on CCB lead-based paint licensing, visit their web site at www.oregon.gov/CCB or call 503-378-4621.

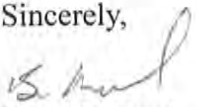

As a certified individual in Oregon, you must meet all the requirements of OAR 333-069, including work practice standards for conducting lead-based paint activities in target housing and child-occupied facilities. As a certified individual, you must perform work under a firm that is certified by the Authority for conducting lead-based paint activities.

You are required to wear the enclosed badge in plain view when conducting lead-based paint activities. Please note that the badge and certificate will expire on 6/30/2017. If you wish to maintain your certification after 6/30/2017, you must submit an application postmarked at least 60 days before expiration and document that your lead-based paint activities training is current.

As a public service the Authority publishes a list of individuals performing lead-based paint activities in Oregon. The list is distributed statewide to consumers interested in lead-based paint activities. Individuals that are certified by the state are eligible to be on this list.

If you have any questions concerning your certification or other aspects of the Lead-Based Paint Program, please contact program staff at 971-673-0440.

Sincerely,

Ben Maynard

RE: LEAD-BASED PAINT ACTIVITIES, FIRM CERTIFICATION NO. 1038--LBP FIRM

This letter is your official notification that PBS Engineering and Environmental Inc. has met certification requirements under Oregon Administrative Rules (OAR) 333-069 to conduct lead-based paint activities in Oregon. Please note that the enclosed certificate will expire on 6/30/2017.

In addition to certification by the Oregon Health Authority (Authority), PBS Engineering and Environmental Inc. is required to be licensed by the Construction Contractors Board (CCB) prior to conducting lead-based paint activities in Oregon. This license is different than, and in addition to, the standard contractor license issued by CCB. Both individuals and firms must obtain this license. For more information on CCB lead paint licensing, visit their web site at www.oregon.gov/CCB or call 503-378-4621.

As a firm certified to conduct lead-based paint inspection activities in Oregon, PBS Engineering and Environmental Inc. must meet all requirements set forth in OAR 333-069. It must comply with standards for conducting lead-based paint inspection and/or risk assessment activities in target housing and child-occupied facilities and employ only certified individuals to conduct regulated activities.

As a public service, the Authority publishes a list of firms performing lead-based paint activities in Oregon. The list is distributed statewide to consumers interested in lead-based paint services. Only those firms that are certified by the state are eligible to be on this list.

If you have any questions concerning this certification or other aspects of the Lead-Based Paint Program, please contact program staff at (971) 673-0440.

Sincerely,

Ben Maynard

AIHA Laboratory Accreditation Programs, LLC

acknowledges that

RJ Lee Group, Inc.

350 Hochberg Road, Monroeville, PA 15146

Laboratory ID: 100364

along with all premises from which key activities are performed, as listed above, has fulfilled the requirements of the AIHA Laboratory Accreditation Programs (AIHA-LAP), LLC accreditation to the ISO/IEC 17025:2005 international standard, *General Requirements for the Competence of Testing and Calibration Laboratories* in the following:

LABORATORY ACCREDITATION PROGRAMS

- | | |
|---|-----------------------------------|
| <input checked="" type="checkbox"/> INDUSTRIAL HYGIENE | Accreditation Expires: 02/01/2018 |
| <input checked="" type="checkbox"/> ENVIRONMENTAL LEAD | Accreditation Expires: 02/01/2018 |
| <input type="checkbox"/> ENVIRONMENTAL MICROBIOLOGY | Accreditation Expires: |
| <input type="checkbox"/> FOOD | Accreditation Expires: |
| <input type="checkbox"/> UNIQUE SCOPES | Accreditation Expires: |

Specific Field(s) of Testing (FoT)/Method(s) within each Accreditation Program for which the above named laboratory maintains accreditation is outlined on the attached **Scope of Accreditation**. Continued accreditation is contingent upon successful on-going compliance with ISO/IEC 17025:2005 and AIHA-LAP, LLC requirements. This certificate is not valid without the attached **Scope of Accreditation**. Please review the AIHA-LAP, LLC website (www.aihaaccreditedlabs.org) for the most current Scope.

Gerald Schultz, CIH
Chairperson, Analytical Accreditation Board

Cheryl O. Morton
Managing Director, AIHA Laboratory Accreditation Programs, LLC

Revision 14: 03/26/2014

Date Issued: 01/29/2016

AIHA Laboratory Accreditation Programs, LLC SCOPE OF ACCREDITATION

RJ Lee Group, Inc.

350 Hochberg Road, Monroeville, PA 15146

Laboratory ID: **100364**

Issue Date: 01/29/2016

The laboratory is approved for those specific field(s) of testing/methods listed in the table below. Clients are urged to verify the laboratory's current accreditation status for the particular field(s) of testing/Methods, since these can change due to proficiency status, suspension and/or withdrawal of accreditation.

The EPA recognizes the AIHA-LAP, LLC ELLAP program as meeting the requirements of the National Lead Laboratory Accreditation Program (NLLAP) established under Title X of the Residential Lead-Based Paint Hazard Reduction Act of 1992 and includes paint, soil and dust wipe analysis. Air analysis is not included as part of the NLLAP.

Environmental Lead Laboratory Accreditation Program (ELLAP)

Initial Accreditation Date: 12/05/1995

Field of Testing (FoT)	Technology sub-type/ Detector	Method	Method Description <i>(for internal methods only)</i>
Paint		EPA SW-846 3050B	
		EPA SW-846 7000B	
Soil		EPA SW-846 3050B	
		EPA SW-846 7000B	
Settled Dust by Wipe		EPA SW-846 3050B	
		EPA SW-846 7000B	
Airborne Dust		NIOSH 7082	
		NIOSH 7300	

A complete listing of currently accredited Environmental Lead laboratories is available on the AIHA-LAP, LLC website at: <http://www.aihaaccreditedlabs.org>
